

1 Figures

Including the following line in your preamble

```
\DeclareGraphicsExtensions{.png, .jpg, .pdf, .tikz, .tex}
```

you tell tex to check for graphics in that order. In other words, by not supplying an extension to `\includegraphics{./figname}`, tex will automatically choose .png before .pdf or .tikz. You can later change the priority order if you want.

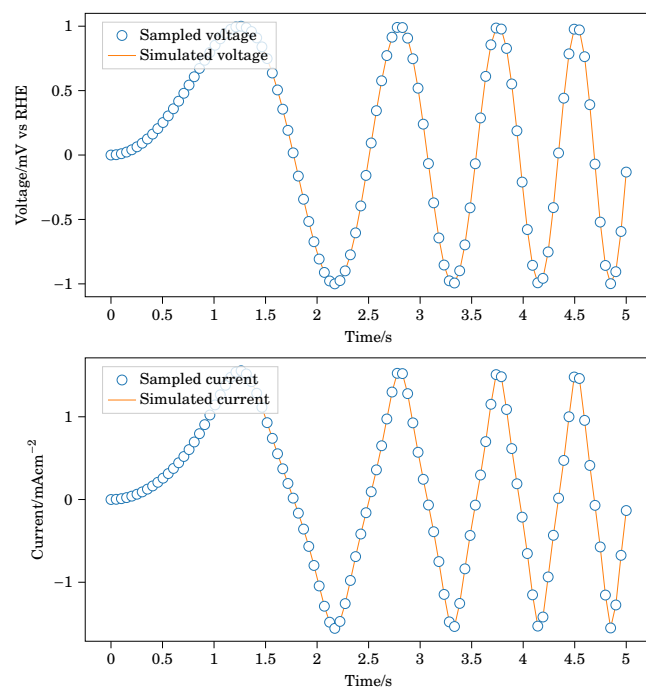

Figure 1: Figure example included without file extension

You can still specify an extension if you like. This was done in fig. 2. Notice the difference between `????` and `??`. The former have simply been scaled to width, while the latter has been generated from .tikz code.

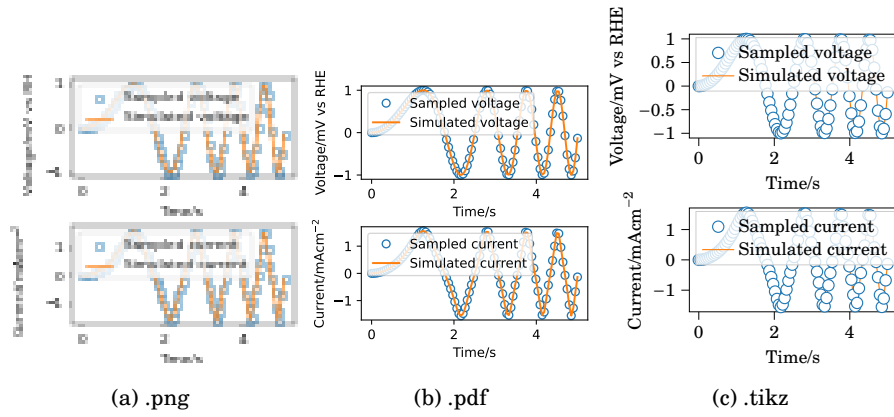

Figure 2: Figures included by specifying file extension.
